## Fact Sheet

The STEPS survey of noncommunicable disease (NCD) risk factors in Kuwait was carried out from March 2014 to September 2014. Kuwait carried out Step 1, Step 2 and Step 3. Socio demographic and behavioural information was collected in Step 1. Physical measurements such as height, weight and blood pressure were collected in Step 2. Biochemical measurements were collected to assess blood glucose and cholesterol levels in Step 3. The survey was a population-based survey of adults aged 18-69. A simple random sample design was used to produce representative data for that age range in Kuwait. A total of 4391 adults participated in the survey. The overall response rate was ( $89 \%$ ).
